Ticket HD-005: Windows Computer Running Slowly

Ticket ID: HD-005

Date Reported: November 12, 2026

Department: Human Resources

Issue Category: Performance / Windows Troubleshooting

Priority: Medium

Status: Resolved (Simulated)

User Description:

An employee reports that their Windows computer has become unusually slow. Applications take longer than normal to open, and the computer occasionally freezes when multiple programs are running.

Initial Assessment:

Possible causes include excessive background processes, limited available storage, high memory or CPU usage, outdated software, or insufficient system resources.

Troubleshooting Steps:

1. Ask the employee when the performance issues began.
2. Restart the computer to determine whether the issue is temporary.
3. Open Windows Task Manager using Ctrl + Shift + Esc.
4. Review CPU, memory, and disk utilization.
5. Identify applications consuming unusually high system resources.
6. Review available storage space.
7. Check for pending Windows updates.
8. Close unnecessary applications and perform approved maintenance.
9. Restart the computer and verify performance.

Resolution:

The simulated technician identifies an application consuming excessive memory in the background. After closing the application and restarting the computer, system performance improves.

Final Status: Resolved

Skills Demonstrated: Windows troubleshooting, Task Manager, system performance monitoring, resource management, software troubleshooting, and technical documentation.
